

Book List Project (React + Node.js)

Hello, Bootcampers!

It's your time to shine. For your final project, you'll create a simple Book List web app using **React** for the frontend and **Node.js/Express** for the backend—**no database needed!**

Project Goal

Build a user-friendly website where people can:

-  **See a list of books** (title, author, rating)
-  **Click a book** to view its details and all reviews
-  **Add, edit, or delete their own reviews** for any book

Show off what you've learned—get creative!

What to Build

Frontend (React)

-  Display all books on the main page
-  Click a book to see its details and reviews
-  Form to add a new review (star rating + comment)
-  Option to edit or delete your own review
-  Clean, responsive design

Backend (Node.js + Express)

-  Use a **JavaScript array or JSON file** to store books and reviews (no database needed)
-  Create REST API endpoints:
 - **GET /books** — List all books

- `GET /books/:id` — Book details + reviews
- `POST /books/:id/reviews` — Add a review
- `PUT /books/:id/reviews/:reviewId` — Edit a review
- `DELETE /books/:id/reviews/:reviewId` — Delete a review

💡 *No login required—just ask for the user's name when they submit a review!*

How to Submit

-  Upload your code to GitHub (one repo or split frontend/backend—your choice)
-  Deploy your frontend (Vercel or Netlify)
-  Share your demo link and GitHub repo(s)

How You'll Be Graded

-  Does your app work? (View books, add/edit/delete reviews)
-  Did you use **React (frontend)** and **Node.js/Express (backend)**?
-  Is the website easy to use and visually appealing?
-  Is your project online and accessible for testing?

 **Deadline: 15 August 2025**
